

Luminet offers RSPs backhaul from NBN Global Switch POI

Luminet has extended its optical fibre network in the Sydney metropolitan area to offer a low-cost, direct fibre backhaul service from the NBN POI and Testing Sandpit located in Global Switch to the Equinix data centres located in Mascot and Alexandria.

Direct Fibre Backhaul

NBN RSPs (*Retail Service Providers*) with equipment located in Equinix can now link directly to an NBN NNI for production traffic; or directly to the NBN Sandpit for Pre-Certification purposes and on-going NBN product testing.

The connections are provided over dedicated hard-spliced fibre links which provide unprecedented speed, reliability and security.

Low Cost

Luminet's infrastructure, resources and processes are optimised for the supply and support of direct optical fibre links. This optimisation, combined with the economics of Luminet's high density fibre cable network, means it can pass on these cost efficiencies in the form of highly competitive pricing.

The resulting fixed price solution is very cost-effective; especially when compared to slower, less reliable and less secure services such as MPLS or Metro Ethernet.

Luminet is a fully licensed telecommunications carrier that focuses purely on providing high performance optical fibre network links.

Luminet combines an experienced team, the latest optical fibre technologies, and a full portfolio of support services to provide you with complete end-to-end optical fibre solutions.

Luminet owns and maintains its own optical fibre network which means you can be assured of receiving rapid, effective and qualified support at all times from a team of professionals.
